11	Reset the Block	

## 2 PROJECT OVERVIEW

Using Argee 3 to program Turck FEN20-4DIP-4DXP block.

Goal of the project: To control lighting of a Banner K50LGRYPQ indication light from a FEN20

Based on two inputs we will create logic for the following states:

- 1) If both inputs are off then the light will be Red
- 2) If Either is on alone that the light will be Yellow
- 3) If bother input are on then the light will be Green

## **3 WIRING OF DEVICES**

First, we will look at the wiring of the K50 to the FEN20.

The FEN20 will be connected via Ethernet Cable to an Ethernet Switch the is also connected to the Wired Ethernet Port of my computer.

The K50 we are using is a GRY meaning Color 1 is Green, Color 2 is Red and Color 3 is Yellow. The Schematic is shown below.

The FEN20-4DIP-4DXP has 8 total IO with the first 4 (0-3) are configurable as Inputs or Outputs. For our exercise with will be using these as Outputs. The second 4 (4-7) are designated at Inputs. So, we will have 4 inputs and 4 outputs.

For the wiring of the FEN20 we have 3 terminals for power is located at the top of the module with Terminal 1 for Ground, Terminal 2 for 24Vdc Common, and Terminal 3 for +24Vdc. For the user's convenience Terminal 2 for 24Vdc Common is fed through to Terminal 1 on the lower terminal block to be used as a DC Comm source. Likewise, Terminal 3 for power +24Vdc is also fed through to Terminal 10 on the bottom terminal strip for DC Supply.

For this project I am using 3 pushbuttons for testing. The first is wired to Terminal 6 for I4 and the second wired to Terminal 7 for I5 and the third is wired to Terminal 8 for I6.

These all use Terminal 10 to supply 24Vdc to the buttons. The outputs that control the K50 will be connected to Terminals 2, 3, and 4 with Terminal 1 wired as common for the K50.

From the K50 Cable: Blue is connected to Terminal 1 for 24Vdc Common, the Black wire is connected to Terminal 2 for Output 0, the Brown wire is connected to Terminal 3 for Output 1, and the White wire is connected to Terminal 4 for Output 2.

Again, the K50 we are using is a GRY meaning Color 1 is Green, Color 2 is Red and Color 3 is Yellow.

## 4 CONFIGURING FEN20 IP ADDRESS

To configure the IP address of the FEN20 we will use the Truck Service Tool.

It can be downloaded using the following link:

### https://pdb2.turck.de/repo/media/\_us/Anlagen/SW\_Turck\_Service\_Tool.zip

Launch the tool to begin the assignment.

-	Turck Service Tool, Vers.	3.2.2	7 SAL COM		C 11		nantali u Artagan in Managan I.		The second back of the second s		×	
	Your Global Automation Partner TURCK											
Sear	P     Image     Image     Image     Image     Image     Image       Search     (F5)     Change (F2)     Wink (F3)     Actions (F4)     Clipboard     Language     Expert view OFF     Close											
No	MAC address	Name	IP address	Netmask	Gateway	Mode	Device	Version	Adapter	Turck, DCP		
Press	"Search" button to de	etect devices.										

Here are the usable functions in the software.

The first step is to use the Search (F5) function to search all connected devices on the network.

The Service Tool will list all devices is finds on the network. Notice there is only this FEN20 and the computer on this network. If you have multiple devices on the network, you can also use the Wink F3 function to flash a light on the device to ensure the correct device is selected.

The next step is to select the FEN20 device (Left Click) to highlight it blue, then use the Change (F2) function to change the IP Address. I will be using 192.168.1.10 for my device as it fits into my current subnet. Here type in 192.168.1.10 or an IP Address that fits on your subnet in the IP Address field and then select Set in Device or Enter.

Change device configuration X Device name:	
IP configuration MAC address 00:07:46:25:B9:96 IP address 192:168:1.10 Netmask 255:255:255.0 0.0.0 Set IP configuration temporarily	
Status messages: Set in device Cancel	
	Change device configuration Change device configuration Device name:  IP configuration MAC address D0:07:46:25:B9:96 IP address D0:07:46:25:B9:96 IP 2168:1.10 Netmask Gateway 255:255:255:0 0.0.0 Gateway Set IP configuration temporarily Status messages: Cancel

Now you will see the IP Address of the FEN20 as assigned.

## **5** STARTING ARGEE

Argee 3 is a programming environment for local logic in Truck IO Blocks. Using this environment, you can turn most Turck Ethernet Blocks into Field Logic Controllers (FLC). Argee is not a programming software, but an environment that runs under a Web Browser preferably Google Chrome.

Argee 3 can be downloaded using the following link:

https://pdb2.turck.de/repo/media/\_us/Anlagen/SW\_ARGEE\_Environment\_v3.zip

By clicking the link, you will download a zip file SW\_ARGEE\_Environment\_v3.zip.

Extract this file in a location on your computer. This will extract a main folder named SW\_ARGEE\_Environment\_v3. Open this folder and you should see the following folders and icons.

Under Reference Manual folder you can find the reference manual for the current release of Argee.

SW_ARGEE_Environment_v3 > SW_ARGEE_Environment_v3 > Reference Manual									
Name	Date modified	Туре	Size						
ARGEE_3_ Reference_Manual_MA3000	6/3/2019 10:07 AM	Adobe Acrobat D	9,872 KB						

Under the Programming Environment folder, you will see these files and the Start ARGEE Programming Environment HTML Link. This will open by default in Chrome if it is installed but will also run in Firefox.

> SW_ARGEE_Environment_v3 > SW_ARGEE_Environment_v3 > Programming Environment v3.2.140.0       ~         Name       ^       Date modified       Type       Size         Image: common       4/15/2020 3:28 PM       File folder				
Name	Date modified	Туре	Size	
📙 common	4/15/2020 3:28 PM	File folder		
Earlier_Environments	4/15/2020 3:28 PM	File folder		
📙 internal	4/15/2020 3:28 PM	File folder		
Start ARGEE Programming Environment	10/4/2019 7:18 AM	Chrome HTML Do	21 KB	

Open the subfolders until you see the Start ARGEE Programming Environment. Double Click to Launch the Argee Environment.

 Program Mode
ARGEE Device IP Address:
192.168.1.10
Enter Program Mode
Simulation Mode
Enter Simulation Mode
Environment version: 3.2.126.0

Type in the IP Address of the Device you will program. Here we see the FEN20 IP 192.168.1.10

Then click the Enter Program Mode button.

Note you can also Enter Simulation Mode if you do not have hardware.

Here we see the default Argee Flowchart for simple logic flow.

For the Green Light we	will create	the logi	ic helo					
	wincreate	the log	ie beiu					

At the top of the page you will see these icons for Argee.

Select the Convert to Argee Pro to open the existing logic in the Argee Pro Environment: Note the Message that you can't convert back to Flowchart after entering Argee Pro.

Once in Argee Pro the screen layout will change. You will also gain programming capability with new Programming Variables, Assign an Alias (Tag) to a Variable Address, and Create Function Block for reuseable function calls.

Here you will also see the converted logic already created and the capabilities to add additional logic.

										TUR	СК
Zi-	Ŭ	Ē	*	$\overline{\checkmark}$	P	TXT	$\bigcirc$				
Run	Debug	p <u>Print</u>	IO Config	HMI	Project	Set Title	About				
								FE	N20-4DIP-4DXP	(192.168.1.10) V3	.3.6.0
	L Keyboa	RGEE ard shortcuts - MainTask	Program								
	0 ±     Condition     (I0_Slot1_Input_Input_value_4&I0_Slot1_Input_Input_value_5)       0.0     Coil     IO_Slot1_Output_Output_value_0										
		Coil	Add Blo	ock							
	Ad	d Condition	)								

Note you have a Condition and a Coil for the logic already created.

#### Next we will add the other logic

+ Keyboard shortcuts (hidden)				
4	Task -	MainTask		
	<u>0</u> ±	Condition	(10_	Slot1_Input_Input_value_4&IO_Slot1_Input_Input_value_5)
		<u>0.0</u>	Coil	IO_Slot1_Output_Output_value_0
		Coil		Add Block

Note the Keyboard Shortcuts: Click the + sign to expand

+ Keyboard shortcuts:

Press Ctrl-q for list of program variables

Press Ctrl-I for list of function block variables

Press Ctrl-i for list of I/O variables

Press Ctrl-f for list of built-in functions

Press Ctrl-s for list of State Names

Here you will see the expanded list of the Ctrl shortcuts to help select items to be used in Logic.

Now we add the second condition for the Red Light. Click Add Condition to add second logic condition.

±	Task -	MainTask		
	<u>0</u> ±	Slot1_Input_Input_value_4&I0_Slot1_Input_Value_5)		
		<u>0.0</u>	Coil	IO_Slot1_Output_Output_value_0
Coil  Add Block				Add Block
	Add	d Condition		

New condition is added to the list.

± Task	- MainTask									
<u>0</u> ±	Condition (I0_Slot1_Input_value_4&I0_Slot1_Input_value_5)									
	<u>0.0</u>	Coil	IO_Slot1_Output_Output_value_0							
	Coil	,	Add Block							
1 ±	Condition		Left Click to select then Ctrl-i to enter the condition							
	Assignm	ent	Add Block							
Ad	ld Condition	)								

We will state the condition (Input 4 and not Input 5) OR (Input 5 and not Input 4).

In Condition use Ctrl-i to list the Input Variables: Click on the -> to move to the next level

SlotØ SlotJ ARGEE_TO_PL PLC_TO_ARGE	(FEN20-4DIP-4E (4DIP-DXP) .C () :E ()	DXP) ->	IO: IO_Slot1 <- Input <- Output <- Diagnostics	-> ->	<pre>IO: IO_Slot1_Input &lt;- Input_value_0 &lt;- Input_value_1 &lt;- Input_value_2 &lt;- Input_value_3 &lt;- Input_value_4 &lt;- Input_value_4 &lt;- Input_value_6 &lt;- Input_value_7</pre>	(Number) (Number) (Number) (Number) (Number) (Number) (Number)
+ Task - Mai	inTask					
<u>0</u> <u>+</u> Co	ndition (IO_Slot1	_Input_Input_valu	e_4&IO_ <u>Slot1</u> _Input_Input_	value_5)

	Coil • Add	d Block				
<u>1</u> ± Co	ndition IO_ <u>Slot1_</u> I	input_Input_value	_4			
A	Assignment • Add	Block				
Add Co	ndition					

#### Next use Ctrl-f for built-in functions, then select -> for Boolean Logic then select &

Since we are using logical "And NOT" Input 5 we use Ctrl-f again and this time select (!) for NOT.

Now again use Ctrl-I to select IO\_Slot1\_Input\_value\_5.

# 1 ± Condition I0\_Slot1\_Input\_Input\_value\_4&!I0\_Slot1\_Input\_Input\_value\_5 Assignment Add Block

Now we have the logic for Input 4 and NOT Input 5. It is easy to select items from the list once you get used to it. You can also type these functions and inputs directly once you are comfortable.

For the second half of this logic we will use cut and paste and modify. Select all the condition and copy. (Right Click and select Copy from the menu, or Ctrl-c also works to copy)

Notice the icon at the lower right corner of the condition. You can Left click this icon a expand the size of the Condition area for better visibility of the logic.

Before Pasting add parenthesis () around the existing condition logic. (IO\_Slot1\_Input\_Input\_value\_4&!IO\_Slot1\_Input\_Input\_value\_5)

Then add a Logical OR | (use Ctrl-f to select from list).

(IO\_Slot1\_Input\_Input\_value\_4&!IO\_Slot1\_Input\_Input\_value\_5)

Then insert another open parenthesis and paste the copied logic ending in a closed parenthesis.

(IO\_Slot1\_Input\_Input\_value\_4&!IO\_Slot1\_Input\_Input\_value\_5)

Then Ctrl-V or (Right Click and Paste) to paste the copied condition statement and add close Parenthesis at the end of the condition statement to surround this pasted condition. Next swap the 4 and 5 in from the input calls. The Condition should now look like this:

(IO\_Slot1\_Input\_Input\_value\_4&!IO\_Slot1\_Input\_Input\_value\_5)|(IO\_Slot1\_Input\_Input\_value\_5&!IO\_ Slot1\_Input\_Input\_value\_4)

So in summary our condition states as: (Input 4 and NOT Input 5) OR (Input 5 and NOT Input 4)

After this condition you can make an assignment

Here we will select Coil from the pull down to make the logic match the previous condition and select Add Block. A Coil will be True when the Logic is True and False when the Logic is False much like a coil in ladder logic.

1 ±	Condition (IO_SI	lot1_Input_Input_value_4&!IO_9	Slot1_Input_Input_value_5) (IO_	Slot1_Input_Input_value_5&!IO_Slot1_Input_Input_value_4)
	Assignment V Assignment	Add Block	2) Select Add Block	
Add	C Timer Start			
	Timer On Timer Off	1) Select Coil		
HMI S	cr Trace Comment	from list		
	Count Up Count Down			
	Reset Counter Call			

Here we us Ctrl-i again and select Output 2 from the list to control the Yellow Light.

1	<u>+</u>	Condition	(10_	Slot1_Input_Input_value_4&!IO_Slot1_Input_Input	:_value_5)	
		<u>1.0</u>	Coil	IO_Slot1_Output_Output_value_2	Left Click to select then Ctrl-i to	
		Coil   Add Block		Add Block	select Output	

Here again we can Run to load the logic in the FEN20 and automatically enter Debug to Test the Logic.

Using Debug, you will see the condition lines turn green when true.

Debu	ıg Displ	ау							
	Edit Code		[]] Halt	Step		Modify Vars			
	201 0000		<u></u>	0000	oominae	<u>mouny vara</u>		FEN20-4DIP-4D	XP (192.168.1.10) V3.3.6.0
<b>A</b>	ARGEE Program								
<u>0</u> ±	Lask - main lask								
	0.0 Coil IO_Slot1_Output_Output_value_0								
1 ±	1 ± Condition (IO_Slot1_Input_Input_value_48IIO_Slot1_Input_value_5)((IO_Slot1_Input_value_58IIO_Slot1_Input_value_4)								
	1.0 Coil IO_Slot1_Output_value_2								

For Review: The logic should not turn the lamp on Yellow if either Input 4 or Input 5 is ON and the other is OFF. It should also turn the Lamp OFF if both Input 4 and Input 5 are OFF, and Green if both Input 4 and Input 5 are ON.

Select the Edit Code Icon to exit Debug Mode and return to Edit Mode.

Next, we will add the final condition for the Red Light when Both Input 4 and Input 5 are false (Off).

After line 1 of the Condition just entered select Add Condition to add another Condition.

1 ±	Condition (I0_Slot1_Input_Input_value_4&!I0_Slot1_Input_Input_value_5)			
	<u>1.0</u>	Coil	IO_Slot1_Output_Output_value_2	
	Coil	•	Add Block	
<u>2</u> ±	Condition			
	Assignment  Add Block			
Add	d Condition			

Here in Condition 2 we will add logic for neither input 4 or 5 being on.

The Condition will be:

!IO\_Slot1\_Input\_Input\_value\_4&!IO\_Slot1\_Input\_Input\_value\_5

Again, use the Ctrl shortcuts to select these Inputs and Boolean Logic

The Coil will be:

IO\_Slot1\_Output\_Output\_value\_1

<u>2</u> ±	Condition	!10_9	Slot1_Input_Input_value_4&!IO_Slot1_Input_Input_value_5
	<u>2.0</u>	Coil	IO_Slot1_Output_Output_value_1
Coil		V	Add Block

The complete logic should not match the image below.

#### ARGEE Program

± K	eyboa	ard shortcuts (hidden)					
<u>+</u> `	Task -	MainTask	MainTask				
0	±	Condition ((IO_Slot1_Input_Input_value_4&IO_Slot1_Input_Input_value_5)					
		<u>0.0</u>	Coil IO_Slot1_Output_Output_value_0				
_		Coil	▼ Add Block				
1	±	Condition	(IO_Slot1_Input_Input_value_4&!IO_Slot1_Input_Input_value_5) (IO_Slot1_Input_Input_value_5&!IO_Slot1_Input_Input_value_4)				
		<u>1.0</u>	Coll IO_Slot1_Output_Output_value_2				
		Coil	Add Block				
2	±	Condition	!IO_Slot1_Input_Input_value_4&!IO_Slot1_Input_value_5				
		<u>2.0</u>	Coll [IO_Slot1_Output_Output_value_1				
_		Coil	Add Block				
	Add	d Condition					

Use Run Mode to Debug and test this Logic. Now we have added logic for the condition when both Input 4 and Input 5 are OFF then the lamp will be Red.

## 7 USING ALIAS VARIABLES

From entering the conditions above, it is easy to see how using "Tag Names" or Aliases would make programing in ARGEE somewhat easier. So, we will experiment with Alias

For this exercise we will create an Alias for each of the Outputs and name them the Lamp Color associated with the Output.

First Select the + beside 1 to expand Alias Variables

<u>1</u> <u>+</u> Alias Variables (hidden)

Then Select Add Variable to create a new Alias

<u>1</u> ±	Alias	Variables
	Name	IO Point

Next type in a Name – We will Use Green\_Light

<b>1</b> ±	Alias Variables		
	Name	IO Point	
<u>0</u>			
Add	Variable		

And use Ctrl-i to select the Output as done in the Logic before.

<b>1</b> ±	Alias Variables				
	Name	IO Point			
<u>0</u>	Green_Light	IO_Slot1_Output_Output_value_0			
Add	Add Variable				

Then add two more variables and map them to Outputs as shown.

<u>1</u> ±	Alias Variables				
	-	-			
	Name	IO Point			
<u>0</u>	Green_Light	IO_Slot1_Output_Output_value_0			
1	Red_Light	IO_Slot1_Output_Output_value_1			
2	Yellow_Light	IO_Slot1_Output_Output_value_2			

Next, change the Coils used to these variables. Use Ctrl-q to select the new variables to replace the direct addressed outputs.

<u>+</u>	Task -	MainTask			
	<u>0</u> ±	Condition	(IO_Slot1_Input_Input_value_4&IO_Slot1_Input_Input_value_5)		
		<u>0.0</u>	Coil	IO_Slot1_Output_Output_value_0	
		Coil Add Block		Add Block	

Delete the old Output\_value\_0 mapping of the Coil.

±	Task -	MainTask		
	<u>0</u> ±	Condition	(10_	<pre>3lot1_Input_Input_value_4&amp;IO_Slot1_Input_Input_value_5)</pre>
		<u>0.0</u>	Coil	
		Coil	$\sim$	Add Block

For the Coil now use Ctrl-q to open a list of Program Variables

Global:		$\wedge$
regl	(Number)	
reg2	(Number)	
tml	(Timer/Counter)	
tm2	(Timer/Counter)	
cnt1	(Timer/Counter)	
cnt2	(Timer/Counter)	
Green_Light	(Number)	
Yellow_Light	(Number)	
Red_Light	(Number)	
PLC_CONNECTED	(Number)	
PROG_CYCLE_TIME	(Number)	

Now for the first Coil select the Green\_Light Variable

Then follow the other Coils as shown below:

Use Debug to test the logic and the mapping of these Output variables.

## 8 TIMERS

Now say we need to add a delay time to one of these conditions.

We want Input 4 to stay true for 5 seconds along with Input 5 to be true before the first condition (Green\_Light) is met.

The first thing we will look at is some additional editing capabilities in Agree Pro.

The first thing we will do is copy line 0 and paste below. This will duplicate the line.

Next, modify Line 0 to delete Input 5 from the condition and change the Coil to a Timer ON.

This will add the new Timer On resultant to the condition

± Task	- MainTask		
<u>0</u> ±	Condition	IO_Slot1	_Input_Input_value_4
	<u>0.0</u>	Coil	Green_Light Here note Timer Name
	<u>0.1</u>	Timer On	Timer: tm1 and time in (ms)
	Timer On		dd Block
1 ±	Condition	(IO_Slot	1_Input_Input_value_4&IO_Slot1_Input_Input_value_5)
	<u>1.0</u>	Coil	Green_Light
	Coil		dd Block

Next Cut the Coil resultant from the Line 0 Condition. Again click on <u>0.0 to open the edit menu and cut</u> to remove the assignment.

AF	RGE	E Progran	n
+ Keyboa	ard short	cuts (hidden)	
± Task	- MainTa	sk	
<u>0</u> ±	Conc	Сору	put_Input_value_4
		Cut	
	0.0	Paste Above	_Slot1_Output_Output_value_0
		Paste Below	ner: tm1
	<u>0.1</u>	Comment Out	pires(ms): 5000
	Tir	Toggle Add Button	Block
1 ±	Conc	Toggle Breakpoint	<pre>put_Input_value_4&amp;IO_Slot1_Input_Input_value_5)</pre>
	<u>1.0</u>		Slot1_Output_Output_value_0
	Coil	▼ Ac	Id Block

#### Now the logic should look like this.

Next change the condition on Line 1 to EXPIRED(tm1) and Input 5

Delete the existing condition on line 1, then use Ctrl-f to open the Timer / EXPIRED(Timer) function.

1 ±	Condition					Delete the existing condition and use Ctrl-f to select Timer Function
	<u>1.0</u>	Coil	IO_Slot1_Outp	out_Output_value_0	_	
Ctrl-f	Coil	•	Add Block )		5	
Function String, Timer Counter Math Bracket Boolear Compare Trigger Bit Ope Advance Protoco	/Arrays /Arrays ts h Logic e erations ed IO/PLC / DI Convers:	Array/Int ( ion - Endi	Dperations - c aness	ould overlap with m	apped IO	Function: <- STAPET TIMER(Timer expiration time) <- EXPIRED(Timer) - returns True if timer expired <- COUNT(TIMER) - returns the number of ms since the timer started -> -> -> -> -> ->
You s	t Co	now se ndition	e EXPIRED	0() in the Cond	dition	
Туре	in tm1	to mat	ch the tm	1 used on the	e Timer O	On assignment.

1 ±	Condition	EXPIRED(	tm1)

±	Task -	- MainTask					
	<u>0</u> ±	Condition	IO_Slot1_Input_Input_value_4				
		<u>0.0</u>	Timer On	Timer:     tm1       Expires(ms):     5000			
		Timer On Add Block					
	1 ±	Condition EXPIRED(tm1)&IO_Slot1_Input_Input_value_5					
		<u>1.0</u>	Coil	Green_Light			
		Coil		dd Block			

Next add AND (&) IO\_Slot1\_Input\_value\_5. Ctrl-i will allow you to select the input

Now when Input 4 button is pressed the light turns yellow then after it is held for 5 second (5000 ms) along with Input 5 button being presses it turn green.

Again, select Run to compile and load the program into the FEN20 and enter Debug Mode.

1	ARGEE Program						
<u>+</u> Та Ω:	k - MainTa Conditio	n IO_Slot1_	Input_input_value_4				
	0.0	Timer On	Timer: tm1 Expires(ms): 5000				
1 :	Conditio	n EXPIRED	tm1)&IO_SIot1_input_input_value_5				
	1.0	Coil	Green_Light				
2 :	Conditio	n (IO_Slot1	input_input_value_4810_Slof1_input_input_value_58((0_Slof1_input_input_value_5810_Slof1_input_input_value_4)				
	2.0	Coil	Yellow_Light				
3 :	Conditio	n IIO_Slot1	_input_input_value_4&IIO_Slot1_input_input_value_5				
	<u>3.0</u>	Coll	Red_Light				
	* Tas Q ± 1 ± 2 ± 3 ±	task - Main Tar           0 ±         Condition           1 ±         Condition           2 ±         Condition           2 ±         Condition           3 ±         Condition           3.0         Condition	Task         Main Task           Q ±         Condition         10_Slott           LQ         Timer On           1 ±         Condition         EXPIRED           LQ         Condition         IO_Slott           L         Condition         IO_Slott           L         Condition         IO_Slott           L         Condition         IO_Slott				

Note, on the left side of the Debug screen you can now see TM1 and its Elapsed Time and Done Bit Status.

## 9 COUNTERS

Now instead of a timer for the Green Light, we need to have Input 4 turn ON 5 times along with Input 5 being ON before turning ON the Green Light.

First, we will add the Count Up assignment under Condition 0

Then Cut the Timer previously specified

Click on <u>0.0</u> to open the modify menu and click on Cut to delete the timer

	AF	RGE	E Program	l
	± Keyboa	ard shor	tcuts (hidden)	
	± Task -	MainT	ask	
	Q±	Cont	Сору	ut_Input_value_4
		0.0	Cut	mer: tm1
			Faste Above	pires(ms): 5000
			Paste Below	
		0.1		punter:
			Comment Out	rset: 1000
		Cc	Toggle Add Button	Block
	1 +	Cone	Toggie	8TO Slot1 Input Value 5
			Breakpoint	
_				

For the Counter use cnt1 and set the Preset to 5.

÷	Keyboa	ard shortcuts (	(hidden)			
<u>+</u>	Task -	MainTask				
	<u>0</u> ±	Condition	IO_Slot1	_Input_Input_value_4	Similar to t	he Timer you
-		<u>0.0</u>	Count Up	Counter: Cnt1 Preset: 5	have the Co and its Pi	unter assigned reset Value
_		Count Up		Add Block		

Now modify the Condition on Line 1 and replace with Counter Expired (when count >= Preset)

This condition will now be: EXPIRED(cnt1)&IO\_Slot1\_Input\_Input\_value\_5

You can replace tm1 in parenthesis with cnt1 by typing, or you can also use Ctrl-f to select Counter and Expired(Counter) from the list.

Function: String/Arrays Timer Counter Math Brackets Boolean Logic Compare Trigger Bit Operations Advanced IO/PLC Array/Int Protocol Conversion - Endi	Operations - could overlap with mapped I ianess	<pre> Function:</pre>
<u>1</u> <u>+</u> Condition	EXPIRED (cnt1) & IO_Slot	1_Input_Input_value_5
<u>1.0</u>	Coil Green_Light	
Coil	Add Block	

When the count has expired, and Input 5 is True, we want the Green Light to turn on and stay on. Add Add Not (!) Expired(cnt1) at the end of Condition on Line 2 and Line 3 to prevent this logic from being true after the counter has Expired. Also note the additional parenthesis around the OR condition on Line 2 to make this OR condition before doing the And Not (&!) the expired counter.

For a counter we also need to have a counter reset. For this we will use an additional input 6 to reset the counter.

<u>4</u> ±	Condition	[IO_Slot1_Input_Input_value_6	
	<u>4.0</u>	Reset Counter Cnt1	
	Reset Co	Dunter V Add Block	

<u>+</u> Ta	ask -	MainTask		
<u>0</u> :	±	Condition	IO_Slot1_Inp	put_Input_value_4
		<u>0.0</u>	Count Up	Counter: cnt1 Preset: 5
		Count Up		DCK
1 :	ŧ	Condition	EXPIRED (cnt1	.)&IO_Slot1_Input_Input_value_5
		<u>1.0</u>	Coil	Green_Light
		Coil	Add Blo	bck
2 :	±	Condition	((IO_Slot1_I	<pre>input_Input_value_4&amp;!IO_Slot1_Input_Input_value_5)  </pre>
		<u>2.0</u>	Coil	Yellow_Light
_		Coil	Add Blo	bck
<u>3</u> :	±	Condition	[IO_Slot1_In	nput_Input_value_4&!IO_Slot1_Input_Input_value_5&!EXPIRED(cnt1)
		<u>3.0</u>	Coil	Red_Light
_		Coil	Add Blo	bck
4 :	±	Condition	IO_Slot1_Inp	out_Input_value_6
		<u>4.0</u>	Reset Counter	cnt1
		Reset Cou		bck

At this point the completed logic should look like the image below.

Again, select Run to compile and load the program into the FEN20 and enter Debug Mode.

#### You will then see this pop-up

## 

#### Select OK then this pop-up will also be displayed

#### This page says

Imported project created on FEN20-4DIP-4DXP(6931090) ARGEE Component Version: 3.6.3.0 Environment Version: 3.2.126.0

Again, Select OK

Now you can select Edit Code and see the logic in the Edit Window.

#### CEAdvancedTech.com

## **11 RESET THE BLOCK**

Open an additional Chrome Tab and type the IP Address of the FEN20 and Enter
